Depletion in groundwater levels and rising energy costs are serious problems in Pakistan. KAN Energy is offering a solar water pumping system to solve this problem, providing a continuous power supply at an affordable cost.

The solar water pumping system generates electricity using a solar photovoltaic system. The photovoltaic array converts the solar energy into electricity which runs the motor pumps. The solar water pumping system draws water from the open well, bore well, stream, pond, canal, etc. Solar water pumping system requires a shadow-free area for the installation of solar panels to start generating a continuous power supply.
